

ABSTRACT

For years, Palaeobiology has been a science that contributes to the natural and cultural history of our planet, as it reconstructs life from its beginnings and provides new knowledge about the evolution of mankind. The new issue of 'Andalusia in history', 'The sciences of the past in history: Palaeobiology', focuses on how these experimental sciences have contributed to the history of Andalusia in recent decades, explaining the method, technique and the most relevant results of some of the sites analysed.
